

ABSTRACT OF THE DISCLOSURE

A fully integrated drying or heating system for the printing, coating, or painting industries that utilizes forced air and electrical heaters. The method for heating the forced air incorporates a solid cartridge heater within a specially designed air distribution system. The nature of this invention allows the operating controls and all the components of the air distribution system and air heating system to be fully integrated into a singular compact package, thus requiring only a pressurized air source and electrical power means to be supplied to the unit.
